GDG Technical Session: "Build Live, Win Live"

Session Duration: 50 minutes
Format: Interactive workshop with live coding and audience participation
Technologies: Google Antigravity, Gemini API, NotebookLM, Nano Banana
Target Audience: Students and developers (beginner to intermediate)

Event Overview

This high-energy technical session combines live application development with audience participation. Attendees will watch an AI agent build a functional web app in real-time, generate creative images using Google's latest AI tools, and compete for prizes through an interactive wheel-of-names game powered by the app built during the session.

Session Flow Diagram

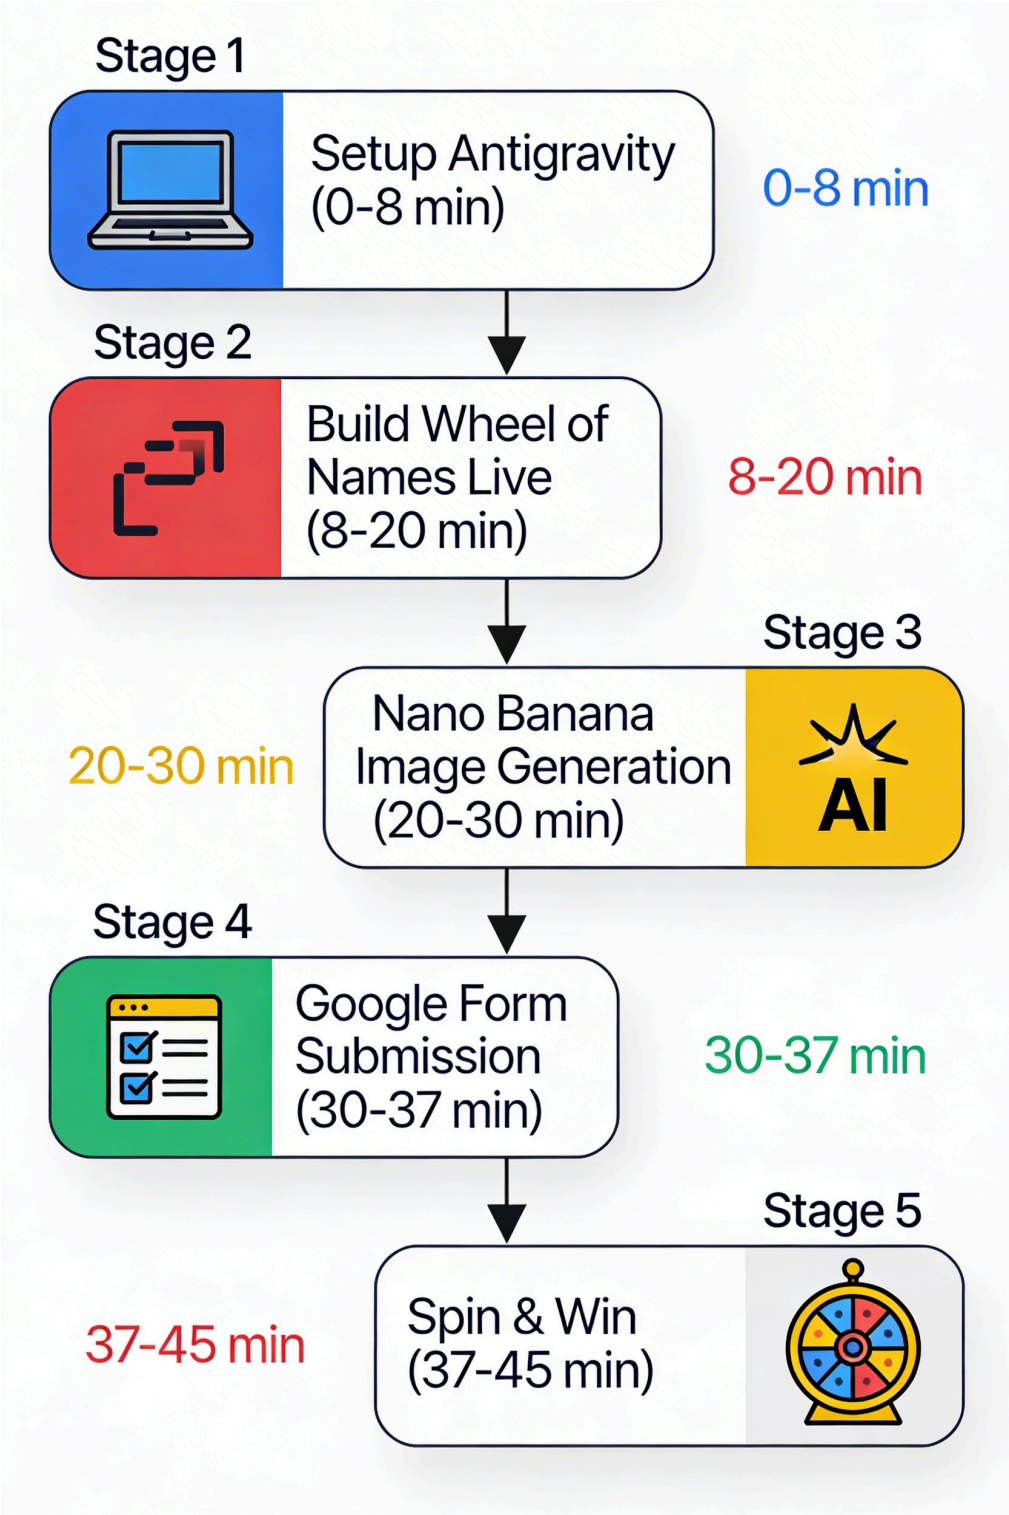

Figure 1: Event Flow: Five-stage progression from setup to prize announcement

Detailed Timeline

Stage 1: Setup Antigravity (0–8 minutes)

Objective: Get all attendees set up with Google Antigravity IDE

- Navigate to antigravity.google and download the application
- Install and launch on attendee laptops (cross-platform: Windows, Mac, Linux)
- Demonstrate the two operational modes:
  - **Editor View** — traditional IDE with AI-assisted coding
  - **Manager View** — autonomous agent mode for hands-off development
- Show model switching capabilities (Gemini 3 Pro, 2.5 Flash, etc.)
- Introduce the MCP Store for Google Cloud service integrations

Key Message: "This is not autocomplete—this is an autonomous agent that plans, codes, tests, and deploys."

Stage 2: Build Wheel of Names App Live (8–20 minutes)

Objective: Demonstrate agent-first development by building the session's prize wheel application

Live Coding Prompt:

> "Build a Python web app with a spinning Wheel of Names. It reads names from a names.txt file and displays an animated wheel. When spun, it randomly picks a winner and highlights it."

What Antigravity Will Do Autonomously:

1. Generate HTML/CSS/JavaScript for animated wheel interface
2. Create Python backend (Flask or FastAPI)
3. Implement file reader logic for names.txt
4. Set up local development server
5. Test and debug automatically

Instructor Actions:

- Narrate each step as the agent works
- Show the generated code structure
- Run the application locally and demonstrate the spinning wheel
- Make one manual edit: configure names.txt path for Google Form integration

Technical Stack Generated:

- Frontend: HTML5, CSS3, JavaScript (vanilla or framework)
- Backend: Python (Flask/FastAPI)
- File I/O: Text file parsing
- Deployment-ready structure

Stage 3: Nano Banana Image Generation (20–30 minutes)

Objective: Engage audience through hands-on AI image generation

Platform: NotebookLM with Nano Banana integration

Demonstration Sequence:

1. Open NotebookLM (notebooklm.google.com)
2. Upload a sample document (event flyer, fun topic, or meme-worthy content)
3. Generate a Video Overview using Nano Banana
    - Show style options: Anime, Whiteboard, Watercolor, Retro
    - Demonstrate Brief vs. Explainer format options
4. Generate a standalone image with a creative prompt example:
    - Prompt: "A developer riding a rocket made of code through a galaxy of data"

Audience Activity (3–4 minutes):

- Attendees open NotebookLM on their devices
- Each person generates an image using any prompt they choose
- Screenshot or save the generated image
- Prepare for form submission in next stage

Why NotebookLM: Native Nano Banana integration, free access with Google account, no setup required, web-based (works on any device).

Stage 4: Google Form Submission (30–37 minutes)

Objective: Collect attendee names for the wheel and showcase their AI-generated images

Google Form Structure:

Field	Type
Your Name	Short answer (required)
Nano Banana Image	File upload (required)

Table 1: Google Form fields for attendee participation

Live Integration Process:

1. Display form QR code on projector
2. Attendees submit (allow 2 minutes for submissions)
3. Open Google Sheets (auto-generated from Form responses)
4. Copy the "Your Name" column
5. Paste into names.txt in the Wheel app directory
6. Save file—application auto-refreshes with real attendee names

Instructor demonstrates: Export → Copy → Paste → Save → Refresh

This creates the live connection between form submissions and the prize wheel.

Stage 5: Spin the Wheel & Announce Winners (37–45 minutes)

Objective: Execute the prize drawing and maximize shareability

Execution:

1. Switch to browser displaying the Wheel of Names app
2. Verify names.txt populated with real attendee data
3. Display wheel on projector for full room visibility
4. **First Spin:** Grand Prize Winner
5. **Second Spin:** Runner-Up Winner

Prize Distribution:

Place	Prize
1st Place	Android Glow-in-the-Dark Collectible (Premium collectible figure)
2nd Place	Android Classic Collectible (Standard collectible figure)

Table 2: Prize structure for wheel drawing

Social Media Moment: Encourage attendees to record/photograph the wheel spin for Instagram, LinkedIn, Twitter posts with event hashtag.

Stage 6: Resources & Call to Action (45–50 minutes)

Free Resources for All Attendees:

- **Google Antigravity** — Free for individual developers (antigravity.google)
- **$300 GCP Free Trial Credits** — Activate at cloud.google.com/free
- **Free Gemini API Tier** — No credit card required (aistudio.google.com)
- **NotebookLM with Nano Banana** — Free with Google account

Takeaways:

- One QR code linking to: GitHub repository with complete Wheel app source code
- Documentation for all tools demonstrated
- Google Cloud getting started guides
- GDG community group (Discord/WhatsApp/Telegram)

Pre-Session Preparation Checklist

Technical Setup:

- ☐ Install Google Antigravity on presentation laptop
- ☐ Test Antigravity prompt and verify wheel app generation
- ☐ Create blank names.txt file in project directory
- ☐ Test wheel application renders correctly in browser
- ☐ Verify local server runs without errors

Google Services:

- ☐ Create Google Form with Name + Image Upload fields
- ☐ Configure Form to save responses to Google Sheets
- ☐ Test Form → Sheets → Export workflow
- ☐ Open NotebookLM with sample document pre-uploaded
- ☐ Generate one example Nano Banana image

Prizes and Materials:

- ☐ Purchase and verify delivery of Android Glow-in-the-Dark Collectible
- ☐ Purchase and verify delivery of Android Classic Collectible
- ☐ Prepare backup GDG swag (stickers, keychains, etc.)

Contingency Plans:

- ☐ Record 60-second backup video of Antigravity building the app
- ☐ Screenshot Nano Banana generation process
- ☐ Download offline copies of all documentation
- ☐ Test mobile hotspot as backup internet connection

Room and Equipment Requirements

Venue Needs:

- Projector or large display (minimum 1080p)
- Stable Wi-Fi with capacity for 30–50 simultaneous users
- Power outlets for attendee laptops (or encourage full battery charge)

- Seating with table space for laptop use

Instructor Equipment:

- Laptop with Antigravity pre-installed
- HDMI/USB-C adapter for projector connection
- Backup laptop or tablet for form monitoring
- Mobile device for testing attendee experience

Expected Outcomes

By the end of this session, attendees will:

1. Understand agent-first development with Google Antigravity
2. Have hands-on experience with AI image generation using Nano Banana
3. See a complete application built from prompt to deployment in under 15 minutes
4. Possess free credits and resources to continue learning
5. Have a working code repository to study and modify
6. Be connected to the local GDG community for ongoing support

---

Post-Session Follow-Up

Within 24 Hours:

- Share GitHub repository with all attendees
- Post recording of wheel spin on social media
- Create gallery of submitted Nano Banana images (with permission)
- Send follow-up email with resource links

Within 1 Week:

- Schedule optional office hours for technical questions
- Announce next GDG event
- Share attendee-created projects in community channels

Additional Notes

Why This Format Works:

The session creates a complete narrative arc where each segment builds on the previous one. Antigravity builds the tool that will determine the winners. Nano Banana creates the engagement mechanism that populates the tool with real data. The Form provides the integration point. The wheel pays off the entire experience with a live, shareable moment.

Attendees are not passive observers—they are active participants whose submissions directly influence the session's outcome. This creates investment, memorability, and social shareability.

Scalability:

This format scales from 15 to 100+ attendees. For larger groups:

- Extend image generation time to 5–6 minutes
- Add additional runner-up prizes (GDG swag for 3rd–5th place)
- Consider using Google Forms in Quiz mode for instant name collection

Customization Options:

The wheel app can be themed for different contexts:

- Hackathon team formation wheel
- Lightning talk speaker selection
- Code challenge bracket randomization
- Study group matchmaking

The Antigravity prompt is the only element that needs modification for alternative use cases.
